

When Less Contact Means Better Care

LifeBed is a powerful, wireless vigilance system that transforms any hospital bed into a wireless, untethered vigilance, analysis and alert network for both cardiac and respiratory functions. Invisible to the patient, LifeBed gives nursing staff the information it needs at the time it needs it, so critical situations can often be avoided. It's just another way we support your commitment to patient safety and better outcomes. And what you'd expect from the world's premiere life vigilance system.

Burn Units – Supporting Hands-On Care Through Hands-Off Technology

Respiratory issues and infections are major factors in the recovery of the burn patient.

- Changes in respiratory function, due to factors such as PCA pumps, narcotics or infection, will activate the LifeBed™ Patient Vigilance System to alert nurses of potential distress and give them a greater opportunity to manage a patient's condition before a crisis occurs.
- The LifeBed supports infection control programs by providing fully cleanable surfaces appropriate for isolation and regular hospital rooms, to decrease the risk of cross-infection and cross-contamination.
- The ability for LifeBed to gauge bed occupancy helps to decrease fall risk.
- The LifeBed provides continuous vigilance of a patient's vital signs, without adding any painful attachment to the skin.
